### Effective Yield Management or Weed Management Programs

#### Yield Management

##### Primextra® II Magnum®

Primextra® II Magnum® provides consistent, high performance, residual weed control.

- Primextra II Magnum delivers excellent crop safety thanks to Benoxacor: The unique safener that virtually eliminates any risk of herbicide injury to the corn crop.
- Primextra II Magnum binds to the soil and stays there to fight weeds throughout the season, but it is broken down in the soil long before it's time to re-plant.
- Primextra II Magnum provides consistent residual weed control for up to 14 weeks after application.
- An early season application of Primextra II Magnum is recommended as part of Foundation Acre™. Research has shown that this approach stops weeds before they start, which results in a substantial yield increase.

#### Weed Management

##### Halex™ GT

**True one-pass, season-long weed control.**

Halex™ GT delivers season-long weed control in one pass. Nothing else gives this combination of convenience and performance in one package. Halex™ GT is the first herbicide designed specifically for glyphosate tolerant (GT) corn production. A state-of-the-art product, Halex GT offers the convenience of glyphosate with the added benefit of broad-spectrum, residual control of the toughest broadleaf weeds and grasses in corn.
